

Customer Insight Research Report

Analysis date: 2026-07-05T16:43:51.947Z

Target Market: Casual Runners

Industry: Sportswear

Location: Indonesia

Disclaimer: This report is for informational and strategic planning purposes only. It does not constitute financial, legal, or investment advice.

1. Target Market Overview

Market Definition

Casual runners in Indonesia are individuals who run regularly (1–4 times per week) for fitness, stress relief, or social activity, not for competitive racing. They typically run 3–10 km per session, on roads, parks, or treadmills. The sportswear industry here includes apparel (shorts, singlets, t-shirts), footwear, and accessories (hydration belts, armbands, caps).

Key Trends and Direction

- Running as Social Activity: Running clubs and community runs (e.g., "Lari Pagi," "Jakarta Run Club") are booming, especially in Jabodetabek, Bandung, and Surabaya. Casual runners increasingly join groups for motivation and accountability.
- Functional Fashion: There is a growing preference for sportswear that works for running but also looks good for casual wear or Instagram. Athleisure is strong.
- Performance Tracking: Wearables (smartwatches, fitness bands) are becoming common, but many casual runners still rely on phone apps (Strava, Nike Run Club, Samsung Health).
- E-commerce Dominance: Shopee and Tokopedia are the top channels for sportswear purchases. Instagram and TikTok influence discovery significantly.
- Value Sensitivity: Despite rising fitness awareness, Indonesian casual runners are price-sensitive. Brand loyalty exists but is weaker than in Western markets.
- Local Brands Rising: Local sportswear brands (e.g., "Specs," "Mills," "ORTUSEIGHT") are gaining traction by offering affordable alternatives to global brands like Nike, Adidas, and Puma.

Digital Maturity Level: Growing

- Social media and e-commerce penetration is high (70%+ internet penetration in urban areas).
- Running apps have moderate adoption; Strava has a growing but still niche user base in Indonesia.
- Digital payment (GoPay, OVO, ShopeePay) is widespread.
- However, many casual runners still discover products offline via friends, running events, or physical stores.

Buying Behavior Patterns

1. Discovery: Instagram/TikTok (influencers, ads, community posts) ! Shopee/Tokopedia search.
2. Evaluation: Price comparison across platforms, reading reviews (especially local reviews), asking friends in running groups.
3. Purchase: Impulse-buy for low-cost items ("dIDR 300k). For shoes (IDR 500k–1.5M), evaluation takes 3–7 days; multiple tabs open.
- 4.

Market Demand & Competitive Intelligence

Assumptions

- "Casual runners" defined as individuals who run 1–3 times per week, primarily for fitness/wellness (not competition), with average weekly volume of 5–15 km.
 - Analysis assumes Tier 1–2 Indonesian cities (Jakarta, Surabaya, Bandung, Medan) as primary addressable market unless otherwise noted.
 - Sportswear includes running shoes, apparel (tops, shorts, tights), and accessories (socks, caps, hydration).
 - Digital adoption in sportswear purchasing is moderate (e-commerce penetration ~40–45% for apparel in Indonesia, higher in major cities).
-

Demand Estimation

Market Size

- TAM (Total Addressable Market): Estimated 30–40 million Indonesians aged 15–45 who exercise casually (any sport). Within this, casual runners represent approximately 15–20% !' 4.5–8 million potential users.
- SAM (Serviceable Addressable Market): Tier 1–2 city casual runners with disposable income for dedicated sportswear: 1.2–2.5 million.
- SOM (Serviceable Obtainable Market): Realistic first-year capture for a new brand (via DTC + retail partnership): 15,000–40,000 customers (1–3% of SAM, typical for new entrant).

Growth Trajectory (2026–2029)

- Current phase: Rapid growth (post-COVID running boom sustained, now maturing).
- Expected direction: Steady 12–18% YoY growth in casual running participation, driven by:
 - Rising health awareness among urban millennials/Gen Z.
 - Government initiatives (e.g., "Indonesia Sehat" campaigns).
 - Expansion of running communities (e.g., Lari Pagi, Indorunners, local Strava groups).
- Risk: Slower growth in Tier 3+ cities due to infrastructure limitations (lack of safe running paths, lower disposable income).

Demand Signals

- Search trends (estimate): Google Trends shows "sepatu lari" (running shoes) search volume up ~35% since 2023; "running apparel Indonesia" up ~50%. Peaks during Jakarta Marathon season (Oct–Nov) and New Year resolution period (Jan–Feb).
- Job postings: Major sportswear brands (Adidas, Nike, local players like Specs, League) actively hiring marketing and DTC roles for Indonesia.
- Funding activity: Increased VC interest in local sportswear DTC brands (e.g., recent Series A rounds for local athleisure startups, estimates of \$3M–\$8M per deal).
- Regulatory changes: Import restrictions on finished footwear (2024 regulation) favor local production and brands; also increases raw

Here is the market intelligence report on Casual Runners in the Sportswear industry in Indonesia.

Assumptions:

- "Casual Runner" is defined as individuals who run 1–3 times per week, typically 3–10 km per session, primarily for fitness or stress relief rather than competition.

Location: Urban centers (Jabodetabek, Surabaya, Bandung, Medan) where sportswear retail and fitness culture are most developed.

- Income Level: Middle to upper-middle class (able to spend IDR 200,000 – 1,500,000 per item on sportswear).

Customer Behavior & Psychology

Decision-Making Process

Awareness Triggers:

- Health scares or weight concerns: Post-pandemic, running became a low-cost, accessible fitness option.
- Social environment: Seeing friends, colleagues, or influencers post run-tracking screenshots (Strava, Instagram) or running event photos.
- Seasonal or event-based: Harbolnas, Jakarta Marathon, or "New Year, New Me" resolutions.
- Algorithmic discovery: TikTok/Instagram ads for a specific shoe or "running for beginners" content.

Evaluation Criteria (Ranked by importance):

1. Comfort & Fit (Primary): The tropical climate (heat + humidity) makes breathability, moisture-wicking, and lightweight feel non-negotiable. Ill-fitting gear leads to chafing, heat rash, and abandonment.
2. Price-to-Durability Ratio: Casual runners are value-sensitive. They are willing to pay a premium (e.g., IDR 800k – 1.5M for shoes) if they believe it will last 6–12 months with weekly use. Cheap gear that wears out in 2 months is seen as a waste.
3. Brand "Prestige" within Social Circle: While not competitive, casual runners care about brand perception. Having a known brand (Nike, Adidas, local rising star) signals "I take my health seriously" without being a try-hard.
4. Style/Aesthetics: The gear must look good for the Instagram story post-run or the coffee shop pit stop. "Gym-to-cafe" versatility is a strong selling point.
5. Tech Features (Secondary): Specifics like "Dri-FIT," "CloudTec," or "Ultraboost" are mentioned but rarely deeply understood. They are used as validation of the price tag.

Purchase Triggers:

- Payday + Promo code combo: The most powerful trigger. "Payday sale" or "free shipping" (which is a major psychological barrier in archipelagic Indonesia) often converts a browser into a buyer.
- Positive review from a relatable source: Not a pro athlete, but an Instagram/TikTok

Opportunity Assessment & Product Concepts

High-Friction Workflows

The Current Reality (Jakarta/Surabaya/Bandung Urban Focus) :

The target customer is not a marathoner. They are a 25-40 year old urban professional who runs 2-4 times a week, often in the early morning or late evening, primarily in their neighborhood, a local sports complex, or a park (e.g., GBK, Hutan Kota).

Workflow 1: The "Gear Decision" (Pre-Run)

1. Need/Impulse: User feels motivated to run, or needs new gear.
2. Discovery: Opens Instagram/Shopee/TikTok. Sees an ad for a new Nike/Adidas/Local brand shoe or an

influencer wearing a specific outfit.

3. Research: Scours comments, asks in local running communities (e.g., FB Group "Runners Indonesia"), or visits a store (Planet Sports, Sports Station).
 4. Decision Block: Overwhelmed by "heat tech," "carbon plate," "dropped heel" language designed for serious runners. Casual runner wants "comfortable" and "won't get hot in humidity."
 5. Purchase: Buys the cheapest option that looks good, or the most recommended one by an influencer, regardless of fit.
- Pain Points:
 - Information Mismatch: Product specs are technical (high-performance), not contextual (tropical humidity, hot pavement).
 - Discovery Noise: Hard to find gear optimized for casual frequency in tropical weather, not elite performance.
 - Trust Deficit: Hard to trust a brand's "cooling" claim when most marketing is global.
 - Automation/Simplification: A "Weather & Lifestyle Fit" recommender (e.g., "This shoe is best for 5k runs in 30°C+ humidity"). No current tool does this for the Indonesian climate.

Workflow 2: The "Post-Run Care" (Recovery & Wash)

1. Run Finish: User returns home sweaty.
 2. Gear Care: Throws shirt and shorts in a pile. They sit for 2-3 hours before washing.
 3. Product Degradation: After 3-4 washes, the "Dri-FIT" fabric smells permanently, the stitching loosens, or the color fades.
 4. Re-purchase Implication: The user assumes the brand is poor quality, or that all sportswear smells. They buy a new shirt from a different brand next time.
- Pain Points:
 - Fabric Stink: High humidity + bacteria growth in synthetic fabrics. This
